

Installation Guide

We provide free installation if you want us to install on cpanel. Just connect with us on WhatsApp / telegram / email from <https://solanacircuit.com/contact/>

Else follow below steps and you can install it by yourself.

Deploy to cPanel: You can download Solana Terminal package from: <https://solanacircuit.com/download/>

Step 1 — Upload to cPanel

Upload the folder 'main.zip' Using File Manager or FTP to your domains or subdomain's document root (e.g. 'public_html' for main domain OR if you are uploading on subdomain say 'app.yourdomain.com' the folder for 'app.solanacircuit.com'):

When done, the folder structure on cPanel should look like:

```
...
public_html/app/
├── index.html           ← from dist/
├── assets/             ← from dist/
├── favicon.svg, icons.svg, brand-logo.svg ← from dist/
├── api/
│   ├── _bootstrap.php
│   ├── public-config.php
│   ├── track.php
│   ├── admin/...
│   ├── lib/...
│   └── data/           ← must be writable by PHP (see below)
...

```

Step 2 — cPanel setup (one-time)

1. PHP version: in cPanel → MultiPHP Manager, set the subdomain to PHP 8.1 or newer.
2. Writable data folder: 'api/data/' must be writable by PHP (755 folders / 644 files). If you get a "failed to write" error later, set 'api/data' to 755 and retry.
3. SSL: turn on AutoSSL for the subdomain (cPanel → SSL/TLS Status) so it serves over HTTPS. Not strictly required for the app to function, but recommended before real wallets are used.

Step 3 — Start clean (important, do this before going live)

1. visit to 'https://yourdomain.com/#admin'
Should show **Create Admin Account. It will run some commands and show a password. Note down password. It will not show again.
2. Immediately log into '/#admin' and: change the admin username/password (Change Admin Credentials panel).

Step 4 — Verify

1. Visit your domain — should show the Connect Wallet screen.
2. Visit 'yourdomain/#admin'
3. Log in and set: Branding, RPC endpoint, Theme, Social Links, etc. — same admin panel as localhost.

IMPORTANT:

RPC endpoint is very much required. Without this app will not work. You can get free RPC endpoint for solana chain from <https://www.helius.dev/>
